

1. The program of calculating tax will allow user to enter the price of an item and automatically calculate the sales tax based of a fixed rate (for example 8%). It will add the tax to the original price to get the final total. This system will even help the shop owner to save time, reduce errors and improve accuracy in pricing.

2. Pseudocode is a method used to plan and design a program using simple human

language instead of real programming code. It helps programmers outline the steps needed to solve a problem before writing actual code.

3. START

Input number

IF number mod 2 = 0 Then

Print "even"

ELSE

Print Odd"

END

Writing pseudocode helped me focus on logic without worrying about programming syntax errors. It also improved my understanding of decision making statement like IF and ELSE.

4.

POSITIVE NUMBER CHECKER
